

REKOLT Planters' Cooperative Produce Tracker - Design v2

This document updates design-v1.pdf with the abstraction and inheritance decisions made while implementing Objective 5. Every difference from design-v1 is logged in change-log.md and this file records the design as it actually stands once those decisions were made, rather than repeating the whole of design-v1.

The diagram above is an updated version of the class diagram from design-v1.pdf, showing the abstraction and inheritance changes that have been made for Objective 5. The main changes are:

- Produce is now an abstract class, with CerealProduce, PerishableProduce, and CashCropProduce providing their own versions of getCategoryMultiplier() and getCategoryName().
- Classes such as SeasonService, Delivery, and the console menu can work with Produce directly and use these methods without needing instanceof checks.

Two new capability interfaces, Payable and Reportable, have also been added. Delivery and Member both implement these interfaces, with Delivery handling its own payable amount and report line, while Member handles its total across deliveries and its own report line. All changes made from design-v1, including these additions are explained in more details in change-log.md
